# ABSTRACT

2

- ❑ **Brain tumor** extraction and its analysis are challenging tasks in Medical image processing because brain image is complicated.
- ❑ Segmentation plays a very important role in the medical image processing.
- ❑ In that way MRI (magnetic resonance imaging) has become a useful medical diagnostic tool for the diagnosis of brain & other medical images.
- ❑ In this project, we are presenting a comparative study of **Three segmentation methods** implemented for tumor detection.
- ❑ The methods include k-means clustering using watershed algorithm, optimized k-means and optimized c-means using genetic algorithm.

# INTRODUCTION

- The BRAIN is the most important part of central nervous system.
- The main task of the doctors is to detect the tumor which is a time consuming for which they feel burden.
- Brain tumor is an **intracranial solid neoplasm**.
- The only optimal solution for this problem is the use of **'Image Segmentation'**.

**Figure** : Example of an MRI showing  
the presence of tumor in

# Technology

## What is MRI machine? How Does It Work?

### 1. MRI MACHINE

### 1. MATLAB SOFTWARE

# Image segmentation

- The purpose of image segmentation is to partition an image into meaningful regions with respect to a particular application.
- The segmentation might be **grey level**, **colour**, **texture**, **depth** or **motion**.
- Example:

...  
...

Fusion based : Overlapping the train image of the victim over a test image of same age group, thereby detecting the tumor.

Demerits :

- ❑ The overlapping creates complexity due to different dimensions of both images.
- ❑ Time consuming process.

Canny Based : To overcome the problem of detecting the edges, the better way is the use of Canny based edge detection.

Demerits :

- ❑ Not support color images.

# PROPOSED METHOD

- ❖ **The method include**
  - 'k-means clustering +watershed,**
  - optimized k-means +genetic algorithm**
  - and**
  - optimized C- means +genetic algorithm'.**
- ❖ **At the end of process the tumor is extracted from the MRI image and also its exact position and shape are determined in colour.**

# Clustering

- Clustering is a process of **collection** of objects which are similar between them while dissimilar objects belong to other clusters.
- A clustering technique is used to obtain a partition of **N** objects using a suitable measure such as resemblance function as a distance measure 'd'.

# CLUSTERING PROCESS

10

**Region of  
interest**

**Center of  
mass**

# Final Clusters

**Figure**  
:

**Clustering  
Technique**

# K-means clustering

**k-means** clustering aims to partition  $n$  observations into '**K**' clusters in which each observation belongs to the cluster with the nearest mean.

(a) original image (b) expert selection

(b) expert selection

(c) K-means selection

# WATERSHED ALGORITHM

- Watershed algorithm is used in image process primarily for **segmentation** purposes.
- This algorithm can be used if the **foreground** and **background** of the image can be identified.

## MERITS:

- It works best to capture the weak edges.
- Watershed algorithm improves the primary results of segmentation of tumour done by k-means.

# K-means clustering with watershed

## Merits:

- ❑ If variables are huge, then K-Means most of the times computationally faster than, if we keep k small.
- ❑ Watershed algorithm improves the primary results of segmentation of tumour done by k-means.

## Demerits:

- ❑ Difficult to predict K-Value & k-means cannot find non-convex clusters.
- ❑ Different initial partitions can result in different final clusters.
- ❑ This method does not work well with clusters of different sizes and different densities.

# C-means clustering

15

- It is well known that the output of K-Means algorithm depends hardly on the initial seeds number as well as the final clusters number.
- Therefore to avoid such obstacle FCM is suggested.
- The fuzzy C-means relax the condition by allowing the feature vector to have multiple membership grades to multiple cluster.

Figure: Result of Fuzzy C-means

# GENETIC ALGORITHM

16

- The term genetic is derived from Greek word 'genesis' which means 'to grow' or 'to become'.
- The implementation of Genetic algorithm begins with an initial population of chromosomes which are randomly selected.

## MERIT:

- It is the best optimizing tool.
- It gives best result when used with Fuzzy c-means clustering...

# C-means clustering with Genetic algorithm<sup>17</sup>

## MERITS:

- This method considers only image intensity.
- Unlike k-means where data point must exclusively belong to one cluster center here data point is assigned to 2 or more clusters.

## DEMERITS:

- Aprior specification of the number of clusters.
- We get the better result but at the expense of more number of iteration.

# MAIN STRATEGY OF PROPOSED METHOD

## K-means Clustering + Watershed algorithm

It is computationally faster, if we take K value

WA used to capture weak edges

## C-means clustering + Genetic algorithm

Here data point is assigned to 2 or more clusters

GA gives best result in little time

Best when works with C-means

## Proposed Method

Tumor is detected with high accuracy

Effectively detects the tumor area & internal

We get the resultant image in color

Structure

# FUTURE SCOPE

19

In terms of the near-future

- ❑ As Medical image segmentation plays a very important role in the field of **image guided surgeries**.
- ❑ By creating **Three dimensional (3D)** anatomical models from individual patients, training, planning, and computer guidance during surgery is improved.

# RESULTS

A stack of brown envelopes is shown, with the top one slightly offset to the left. Resting on top of the envelopes is a rectangular, light brown card. The card has the words "thank you!" printed in a large, bold, black, sans-serif font. The card is tilted slightly to the right.

**thank  
you!**
